PROJECT DESCRIPTION

Due to layout of the parking lot and snack stand for this sports complex being located on a small bluff above the baseball field, storm runoff was washing into a gully between the lot and the field. Larger rain events would flood the dugouts and wash away some of the infield dirt. To address this issue, 15” Nyloplast drainage structures with Hinged grates were specified for the rehabilitation project to fix this problem.

PROJECT HIGHLIGHTS

Because the installation was performed during the season, Nyloplast was specified in part because of the low impact and speed of installation by the DPW workers. There were no issues during install, and when interviewed, the DPW chief praised the product and will send a formal letter of approval.
